Hi,

I am trying to learn about writting HDF. I must admit that helps/
manuals are not so helpfull in understanding HDF. I found some fine
example and learned how to write and read one image but my problem
here is a bit different. Or maybe not?

What I am trying to do is to put about 40 000 spectra into HDF
format. These are in standard format ie. has 3 columns (lambda, flux,
error). Could somebody direct me how to do this? Regarding to size, is
it posible at all?

Thanks in advance
oliver
