Subject: format string with many many quotation marks Posted by rchughes on Thu, 05 Jul 2007 20:37:52 GMT

Dear All,

I'm trying to create a format string that looks like this: (5("", A0, "'", :, ", ") ) <- There are single quotation marks between the first two double quotations.

I want to get something like this

```
a = SINDGEN(6)
print, a, FORMAT=val_fmt
to get:
'0', '1', '2', '3', '4', '5'
What i currently have for a format string is this:
val_fmt = '( ' + STRTRIM(STRING(cnt), 2) + $
 '(' + "'" + ', A0, ' + "'" + ', :, ", ") )'
```

This one is wrong because it does not contain the double quotation marks enclosing the single quotation marks. Can someone please explain to me how I could do it or tips on how to use the BYTE method to produce a string output like this.

Thanks, Ryan.
