Some information about the answers of 3-4 are at:

<http://ittvis.com/ion/>

Remember that ION Script doesn't require the user to download anything, but "interaction" means that clicking on a graphic or hitting the "Submit" button creates a new web page that is then served to the client. In ION Java, the client has to download Java and you have to program in Java (with some ITT VIS provided Java classes), but more interaction is allowed (i.e. a flythrough might be possible, but I don't have experience with this).

Mike
