I'm finally trying to switch my habits from using tags files to idlwave library catalogs, but I'm having trouble trying to figure out how to use it. The docs say that idlwave-create-user-catalog-file will give me a list of the directories in the IDL search path, but it doesn't include them all. It seems to include only those explicitly in !PATH, so the current working directory is not included. Is there a fix for that?

Mike
