Thanks for your help,David.

But I still have a question,my program is using object-oriented graphics mode.When I use the TVCRS in my program,it indeed changed the position of the mouse,but not the position I want it.I've wrote that:"TVCRS,0,0,/DEVICE",but the position of the mouse change to the left side of the center of the screen,rather than center of the screen.Is there any other way can change the position of the mouse in object-oriented graphics mode?

Thank you again!You really did a lot of thing to helping the people who are learning or using IDL.
