Subject: Size of image using tvscl?

Hi,

I'm plotting a scaled image using tvscl but I can't seem to change the physical size of the resultant image (I need it to be bigger!). I see that xsize and ysize will not work for 'pixel-based devices that are unable to change the size of their pixels', like my screen. So is there no way round this other than to use .ps for example?

Thanks in advance,

Hazel

P.S. I always read this newsgroup and it's got me out of some scrapes so thanks!
