
Subject: recommendations for curve fitting

i'm looking to add a trend- / fit-line to my plotted data, and not finding any really nice and easy way to do so. the plot is currently being generated with the PLOT command, and I'm not looking for anything much more complicated than a quadratic fit (probably even just linear). i tried using IPLOT and adding a curve fit there, but it didn't work very well and was kind of awkward.

does anyone have any good recommendations for fitting a trendline to a scatter plot? as i said, it will probably be as simple as linear / quadratic in nature.

thanks.
