An observation I just made for IDL ver 3.5.1 and how it interprets SQRT(-1).
This should produce an error.

On a VAX 4000 WITH openvms you get:

```
IDL> a=sqrt(-1)
% Program caused arithmetic error: Square root of negative number
% Detected at: $MAIN$  (SQRT).
```

On a alpha running open vms you get:

```
IDL> a=sqrt(-1)
IDL> print,a
% PRINT: Variable is undefined: A.
% Execution halted at $MAIN$  (PRINT).
IDL>
```

On an alpha running unix/ultrix/osf:

```
IDL> a=sqrt(-1)
IDL> print,a
0.00000
```
