hi there,

i'm new programming in idl, and i have a small problem.

i know, that with `dialog_pickfile()` i can select a file and idl returns a string of the whole directory and the file.

Is there also any possibility to get such a string only when choosing a directory?

My problem is, that i want the user to choose only a directory and not a specified file.. because in the directory itself, there are always the same filenames, which have to be analyzed. But what changes is file path. So I want the user to give a possibility to browse and to select the current project path in my widget.
any suggestions?

thanx a lot
