I'm not 100% sure of your question, but I think it's "My application
has data files associated with it. How do I find the location of these
data files when it is installed on someone else's computer?"

The two methods I use are:

  1. Install the data files in some location relative to the program
code (like in the same directory or in a subdirectory). Use
MG_SRC_ROOT to find the location of the program code and then use
FILEPATH to get the location f the data files. (MG_SRC_ROOT is at
 http://michaelgalloy.com/wp-content/uploads/2007/07/mg_src_r oot.pro)

  2. Put the data in some special place that I can find later (i.e.
using APP_USER_DIR).
