Can somebody tell what exactly dist function is doing in IDL

e.g x=dist(2,2)

0.000000	1.000000
1.000000	1.414213

What is the meaning of this output

x=dist(4,4)

0.000000	1.000000	2.000000	1.000000
1.000000	1.414213	2.236071	1.414213
2.000000	2.236071	2.828431	2.236071
1.000000	1.414213	2.236071	1.414213

I am unable to understand the output which is being generated.
