Hello,

i'd like to read arrays (3 columns, 2072758 lines) from more than one file do get some kind of data(k) where k (k=146) is the number of files and data is the array.

For one file it works quite well with:

```
data = read_ascii(file) & data = data.(0)
g = data[0, *]
r = data[1, *]
nir = data[2, *]
```

For this code i do not need to declare data, g, r and nir

But i do not know how i can manage it for k files (without getting error messages).

Britta
