Wox,

Since you're not experiencing any troubles, I'd like to know what were the measures taken when you tried to install IDL 6.4 on FC 7.

I run IDL 6.3, and have to add/update/downgrade the following packages so I can get started. If you could send me your judgment over my configuration, I'd appreciate.

compat-libstdc++-8-3.3.4.2.i386.rpm
xorg-x11-deprecated-libs-6.8.1-12.i386.rpm

Plus: Nvidia driver (so far, just the one from livna repositories)

I've experienced a few problems with the 'compiz' feature of FC 7, and I'll probably reinstall the system on one machine because of that (that was the conclusion of quite a few posts at one forum over FC7).

Best regards.
