---

hello, I have a secen ASTER data named as "pg-

other files that have the same filename with suffix such as ".met", and so on. When I read it by ENVI from "file----open image file" or "file ----open external file---eos---aster", all the bands can be showed in "available bands", and the DN of VIR band is float type and more than 1, which shows it is not reflectance. I want to know how to get the reflectance for visible or infrared bands and the radiance for Tir of such ASTER data in ENVI or ERDAS? please help me, thank you.
