Hy all!!
I'm having a hard time with this problem about alpha channel. I wish
someone with experience in it could help me.
I need to generate an image with transparency. This image will be used
on top of other image in another application out of idl. It's a web
application. I based on 2 routines from idl examples that work with
alpha and process images in IDL: "alphacomposite_doc.pro", and
"alphaimage_obj.pro". I need to have the image with the alpha channel
on the OUTPUT. Is this possible??

Any help would be appreciated

Aleksander
