Hope this is not a previously reported bug in version 4.0.1 VAX VMS.

The bug can be demonstrated by

```
Print,format='(3F6.0)',49.4,49.5,49.6  
49. 4:. 4:.
```

The IDL format processing does not round the numbers up correctly.
It probably can be traced to a ascii nine is 39H and a 3AH is a
semicolon. Bug is not present in Windows 4.0.1 version.
