Thanks for the tip.

SPACE is useful.

YPAD helps a little but doesn't do quite what I was wanting. It puts space both above and below the row. I was wanting space above row N, or below row N-1 because there is a row N+1 where I don't want the extra space... like a blank line between paragraphs in text.

I had also experimented a little with the ALIGN and BASE_ALIGN keywords. But in my app they don't seem to have much affect at all.
