
Subject: Loss of THICK keyword in AXIS command

The AXIS command no longer allows the use of the THICK keyword under IDL version 2.4.0. The thicknesses are now controlled by the !X(yz).THICK system variable. Why was this regressive "feature" introduced into Version 2.4.0? Well I guess I'll have to edit all those programs so that they save the current values of x, y, and z -.thick, set them temporarily to a different value, call AXIS, and finally restore the original values 8-(.

On a positive note, I'm very pleased that V-2.4.0 allows the formatting of axis tickmark labels to be under program control.
