Subject: stack vector plots

Folks,

My requirement may be too trivial. I have 1D vector data with time on x-axis and discrete locations (latitudes) on the y-axis. I want to stack them up along these different latitudes. What would be the best way to plot such data? And how would I include time info? I tried using `one_arrow` along with julian seconds, but then the `!x.crange` values gets real large and nothing is plotted as a result. Any thoughts/ideas?

Thanks in advance,

/rk
