I have installed IDL 6.4 on my notebook(Debian Sid), when I am in office and the idl in command line access mode starts very quick, but when I in other place, for example home and start idl:

1. in command line access mode: very slow
2. idlde in gui mode: very quick
3. if I empty the /etc/resolv.conf, the idl in command line access mode starst very quick.

Why does idl depend on the network, can you help me?
Thank you.
