

Hi,

I made one application for which some part I have developed in IDL.  
For this application I made save file in IDL which run correctly If I  
run it through command prompt on Windows with the command given below.

```
idlrt -vm "D:\myapp.sav"
```

I made a bat file simple.bat. which contain the same above command.  
When I run this bat file from the command prompt my application is  
running fine.

The entire application is in Java. I have only installed IDL virtual  
machine on my Windows XP machine. and I have written following code in  
Java to call the application.

```
Runtime r=Runtime.getRuntime();  
Process p=null;  
try  
{  
    String s="D://simple.bat";  
  
    p=r.exec(s);  
}  
  
catch(Exception e){  
    System.out.println("error==="+e.getMessage());  
    e.printStackTrace();  
}
```

But the problem comes when I try to run the code from Java file. I am  
not able to run IDL application. At the same time one good thing I  
found in above code , It is not generating any error :-).

Appriciate If you could help me in this regard.

-Chintan
