Hi all,

I have an IDL widget application which allows users to compare RAMAN spectra with reference spectra. Now I want to make it web-based with ION Java. The reference spectra are on the server, the user's spectra off course not.

I never used ION before and I have the following question: "Can one translate a widget app. easily to an ION Java Applet or do the widgets get replaced by JAVA code (in which case I can just as well make everything in JAVA)?"

Thanks.
