---

I have used IDL to analyse data in my MSc project. I am writing up my dissertation now and want to know if there is a specific term for one of the processes I have used.

The data are in several vectors of the form (a, b, c, d,...). I have found the change in value from one point to the next and then analysed those, i.e. the data is in the format (a-b, b-c, c-d, d-e,...). Can someone tell me what the name for this process is (if there is one, and I'm sure there is).

Many thanks
