Adding to David's notes,
bear in mind that in order to be on the safe side, the IDL version you use should better be the same as the costumer will use. in addition, you should make sure that all procedures will be pre-compiled and defined when you save them.

if things do not work right on the costumers machine, check the error message carefully. it will possible define the procedures or functions which are unrecognized and which you have to add to your save command. see also IDL help on SAVE.
