
Subject: How to export latlongs?

Hi there!

I have some geotiff images which are being read into an array using `read_tiff`.

I would like to export this array to ascii text files, using this structure:

latitude, longitude, pixel value

Three columns and 'n' lines, where 'n' is the number of pixels of the image. So, for each pixel, I have one line with the coords and the pixel value.

I'm trying to do that using ENVI/IDL. That's a very usual problem... Does anybody have some code for that?

Thanks,
Julio
