OK, I see I don't have to drag anything, they are
already in the Libraries project. (Libraries originally
didn't have an open folder option next to it when it was
created, so I didn't realize this.)

OK, I've deleted the other projects, and have my Libraries
projects set up like I want them. Now I have my Default
project, which I have renamed Work. I see that this
changes the directory name under the IDLWorkspace
directory to Work, too. OK.

Now, I am ready to add work directories to my Workspace.
I want a directory called NSIDC to reside in my Work
project. But if I create a new project named NSIDC, and
ask it to be created in the Workspace, it creates a
directory in the IDLWorkspace directory, but it adds
the project to the "main" level of projects. (Where
Libraries and Work live.) How do I get this project
to go into the Work directory and live there?

Or, is this even what I want to do? I'm still very
confused about project organization.

Cheers,

David
