Wait a minute... It seem that the IDLDE process just didn't stop. I'm trying again. I'll let you know what happens.

It seems that the background process of "Analyzing code..." continues after I quit the IDLDE - I have a fairly large path, and it takes several minutes to "analyze", so during this testing I quit IDL before the background process was finished - That locks the IDLDE workspace. This is not acceptable. I think that 7.0.1 needs to have a "Analyzing code..." work-around. Oh for my command line and emacs...
