Ah, the Linux title threw me off.

Naturally this is the result of the workbench searching through the path, but I'm a bit concerned at how much longer this takes than in 6.4, and how much bandwidth will be used up on our server when we have 10 or 15 users signed in. Also, this will effectively force all users to setup a workspace and juggle projects for all the libraries, which means I can't just tell new users who just write simple programs to ignore the projects\workspace features.
