Subject: question about paths/workspace
Posted by R.G.Stockwell on Wed, 05 Dec 2007 18:16:33 GMT

I have my idl code on a networked raided backedup drive,
but often take my laptop away from that network.

So I have my path setup to look for the network first (drive H say)
then look on the laptop (drive C). It works pretty well.

If I put my 'workspace' on H, and am off the network,
I get 'workspace cannot be found' errors and it forces
me to create a new one.

Anyone have a good solution to using travelling workspaces?
I haven't really looked into the problem much yet, maybe it's
a stupid question with an obvious answer.

Cheers,
bob
