Well, unless I am missing something (likely), you have to change perspectives to work with the Subclipse plug-in, too.

This could be made a lot less onerous if I could somehow put the SNV Repository perspective in the \*top\* of the Open Perspective menu instead of always having to choose Other to get there, and then having to choose Other again to get back to the IDL perspective. I have a feeling this is probably a configurable item, but if so, I haven't found the right magical incantation to make it happen.

Cheers,

David
