Well, here is what I did, which is what I thought I was trying to do. Tell me if I did it right.

I switched to SVN Repository perspective and did New -> New Remote Folder to create a new folder in the repository.

Then, I found that newly created folder in the repository (still in SVN Repository perspective) and right-clicked and chose Checkout. This gave me a Project in my IDL Workspace.

I switched to IDL Perspective and right-clicked on the new project, and chose Import... This allowed me to import my IDL files into the project.

Then, I simply right clicked on the project folder again and chose Team -> Commit. This copied all those IDL files over into my repository.

Does that sound right to you?

Cheers,

David
