Hi guys,

maybe it's just something about the way I've got things set up, but I can't seem to get Variable Watch to update correctly after I use DELVAR to delete more than one variable at a time since I upgraded to v7.0 - is anyone else having this problem?

```
> a=1&b=2
```

```
> delvar,a,b
```

```
; check variable watch -> still says b is defined as value 2, type INT
```

```
> help,b
```

```
IDL> B          UNDEFINED = <Undefined>
```

As far as I can tell this seems to happen to all parameters that DELVAR is called with after the first one, which is handled correctly. Can anyone replicate this?

Thanks

Chris
