Subject: DELVAR in IDL7.0 for windows
Posted by Spon on Mon, 17 Dec 2007 13:41:34 GMT

Hi guys,

maybe it's just something about the way I've got things set up, but I
can't seem to get Variable Watch to update correctly after I use
DELVAR to delete more than one variable at a time since I upgraded to
v7.0 - is anyone else having this problem?

> a=1&b=2
> delvar,a,b
; check variable watch -> still says b is defined as value 2, type INT
> help,b
IDL> B   UNDEFINED = <Undefined>

As far as I can tell this seems to happen to all parameters that
DELVAR is called with after the first one, which is handled correctly.
Can anyone replicate this?

Thanks
Chris
