Dear IDL gurus and pundits,

Once again I am back to you guys to seek help.

I was working with itools, specifically, icontour. I created a style of my own. Now the problem started when I made my style as the default.

Now each time I run the icontour, it can even launch.
Rather an ominous window pops up saying:

"A system error was detected during tool creation:
Unable to invoke method on NULL object reference : <OBJREF
(<nullobject>)>"

I tried using the proverbial 'itreset' command. It seems like working, but in reality, it does not. Because as soon as you restart the icontour, same freaking window pops up.

HELP.....!!
