In the IDE I have no clue, but in the UNIX command line I might do something
like this:

```
print,"this"+string(13b),format='$(A)'  
print," is "+string(13b),format='$(A)'  
print," all"+string(13b),format='$(A)'  
print," on "+string(13b),format='$(A)'  
print,"one "+string(13b),format='$(A)'  
print,"line"
```

Well, I wouldn't really do it like this, of course. But I use that kind of
thing often for a "percentage done" type of thing.
