Hello-

I'm thinking about undertaking some work to be able to take data structures or arrays in IDL and visualize them in google earth. The idea is to build an object orient set of codes which will write the data into .kml files.

Has anyone begun this or thought about it? I'm going over the .kml specs and making some headway, but i clearly dont have then entire picture yet. I have a small goal of getting some (extruded to the ground) polygons working in the very near future.

thanks,

jlm
