Folks,

Does anyone have the foggiest idea how to configure and setup a PostScript printer in an iTool so that the Print button can send the graphic straight to the printer on a UNIX system?

Or, failing that. I know how to export the graphic to a PostScript file that I can send to the printer. But the PostScript is an encapsulated PostScript file, with a bounding box and a PostScript showpage command, I guess, since I can actually print the file. But, because it is encapsulated PostScript, the graphic comes out in the lower-left corner of the page, and it would be so much nicer if it were centered. I have vague recollections of some kind of program that would take a poorly designed file like this and center it for you, but I can't recall the name.

Does anyone have a trick for making \*centered\* PostScript output from an iTool?

Cheers,

David
