Subject: Re: IDL workbench & windows
Posted by elwood on Fri, 01 Feb 2008 01:04:54 GMT

One last note for any illustrious readers:
When I have re-opened a project, the project explorer shows my idl source file
and the fits file that I am trying to read.
However Even though the path to the fits file is in my IDL path,
it doesnt seem to know where the fits file is unless I cd to the
directory where it is located.

My quick read of how the idl path works under windows is that it
search for .pro and .save files in those locations.
How can I make it know about other files??
