Hi All,

I'm trying to add a 1x2 array to the end of an Nx2 array to obtain a (N+1)x2 array using the square bracket concatenation trick, but based on my limited understanding of it, I can't get it to work. I've looked at JD's tutorial on David's website but I still don't get it.

Here is an example of what I want to do:

```
IDL> array = [[1,2,3,4],[1,2,3,4]]
```

```
IDL> print, array
```

```
1    2    3    4
1    2    3    4
```

I want to add another pair to the array to get this:

```
1    2    3    4    5
1    2    3    4    5
```

I want to execute a command similar to this one but I can't figure out the correct number of brackets:

```
array = [[array], [[5,5]]]
```

Thanks,
Ryan.
