Ryan,

only as a guess I think that the "Network is unreachable" error is a
mapped network drive or NFS mounted drive issue. That is an error
that one sees a lot setting up Linux networking. I wonder if you are
doing something with a network file that you don't have permissions on
or something like that. But this is reads which is also really odd as
it isn't a file command... ok I don't know anything.

Brian
