Hi All,

Does anyone know what this error message is telling me?

```
% End of input record encountered on file unit: 0.
```

```
  Network is unreachable
```

```
% Execution halted at: RCH_GETPORTNUM    77
```

I've looked into the file and `rch_getportnum.pro` has 89 lines according to Emacs and it also says that it has 89 lines according to `FILE_LINES`.

Network problems shouldn't be an issue because I'm running IDL on the machine with the file through SSH. I've used this routine many many times in the past and haven't changed it in a while. Any help would be greatly appreciated.

Ryan.
