
Subject: workbench project rename: bug?

Just had an interesting idl7.0 workbench error pop up:
Was renaming a project to something more meaningful using the
workbench file->rename menu.

Workbench sent a bunch of errors to screen when I tried to rename.
Errors concerned moving folder contents and deleting a folder.

Original project folder was named project4
new one is project4_feb14

It DID rename and move contents but left an empty project4 folder
sitting there.
Project explorer couldn't see this folder.

AND when I closed and restarted workbench I discovered that it still
had project4 in its path,
but not project4_feb14

I removed the incorrect path and added the appropriate one and
ALL is fine!

I thought I'd send my experience to the denizens of this group to see
if anyone had similar experiences.

If anyone knows where the workbench error log file is kept I'd be glad
to send a copy of it to anyone who wants it.
