Once I stopped searching specifically for DEFROI and focused on IDL mouse input with Mac/X11, I found the solution in the archives of this list in this discussion:

[http://groups.google.com/group/comp.lang.idl-pvwave/browse\\_thread/thread/22a4dd450fae723d?tvc=2](http://groups.google.com/group/comp.lang.idl-pvwave/browse_thread/thread/22a4dd450fae723d?tvc=2)

The

solution is to change a hidden preference in X11.app using the following:

```
defaults write com.apple.x11 wm_click_through -bool true
```

A little embarrassing that my first question to this list was already answered, but at least I'm glad I can get my program written.
