Noah, Chris,

The fact that the series expansions (chss) works better for some paramters is what led me to use both implementations. You may not need as many terms (169) as you are using. I usually use about 20 - 50 and see no change in the result after that. I am a little lazier than Chris, so I didn't put a lot of effort into determining why the integral representation was failing. If someone pieces that together, I would like to hear about it.
