Can't help with this, but we were trying to use IDLnetURL to ftp a simple
PNG file. It works fine to one ftp server, put crashes IDL (seg fault
or bus error, depending on hardware) to a different ftp server. Command
line ftp works fine to both servers.

We might be doing something wrong, but we still shouldn't be able to crash
IDL. :-)

We have filed a bug report (and switched to SPAWNing a curl process).

Cheers, Ken Bowman
