After getting educated about the http client protocol, I figured it out. Basically, you find the url that to which the form will be submitted from the 'action' field of the form, and append the field name and value pairs to the end of that url. Here's a sample if someone's interested:

pro websample

```
ourl = OBJ_NEW('IDLnetURL')
content1 = ourl->get(url='http://www.google.com', /string_array);
print, 'Contents of google.com:'
print
print, content1
print

content2 = ourl->get(url='http://www.google.com/search?q=IdlnetURL', /
string_array)
print, 'Contents of searching google for idlneturl:'
print
print, content2

OBJ_DESTROY, ourl
end
```
