Thanks David. I played with the h5_browser and I can not read the h5 sample data I have. We want to save our experimental data by using the table structure available with hdf5 format (which is produced by python). However, in IDL we can not read this. I developed a class hdf5 following your code `ncdf_data__define` which performs OK with non-structured data, but it can not read tables. Do you know how to read this kind of compound data?

Best wishes,

Giorgio
