Hello,

I was wondering if any one has used the widget builder (WIDED) on a Macintosh. I am using IDL 4.0.1 and WIDED can't write the ".PRO" file. Has any one else seen this problem?

I am not doing any thing fancy, just trying to follow the tutorial. I have just started learning about widgets and thought that this would be a good way to get my feet wet. If any one out there who is an experienced widget programmer has any advice, it would be appreciated.

Thanks in advance,

- Saeid
