
Subject: IDL7.0 Workbench: configuring cursor focus

I'm still re-learning to use IDL7.0 and am constantly fighting it.

Particularly the very annoying behaviour (I feel) that is the workbench always restoring the editor cursor focus back to where ever the code was halted.

For example, I've run a 100 line piece of code to a STOP at the end. I notice I want to tinker about with line 20, so I go there to line 20, edit it and decide to drag-drop this new line onto the command-line. Well, the workbench then snaps the editor cursor back down to the END at line 99. I'd really like to turn this behaviour off.

Also, I notice if one drops another file into the workbench, the focus won't go to this new editor window. Is this configurable?

Surely, stuff like this is ECLIPSE configurable?

Ah, Peter
