Erik, How are you zooming? I never use ROI's, but I would think that if you are zooming by changing your viewplane rectangle that the ROI's would "zoom" too. Here's the zoom method from my camera code:

```
pro Camera::Zoom, zoom
   ; Zoom the camera view by the specified zoom factor.
  compile_opt idl2
  if (N_ELEMENTS(zoom) eq 1) then begin
     case 1 of
       (zoom lt -1.0) : self.zoom = (-1.0D / zoom)
       (zoom gt 1.0) : self.zoom = zoom
       else: self.zoom = 1.0D
     endcase
     viewplaneRect = dblarr(4, /NOZERO)
     viewplaneRect[0:1] = self.viewcoord[0:1] - $
          (self.viewRect[2:3] / (2.0D * self.zoom))
```

viewplaneRect[2:3] = self.viewRect[2:3] / self.zoom

```
self -> IDLgrView::SetProperty, VIEWPLANE_RECT= viewplaneRect
endif
```

end

Set up the vars that store the initial state once, after you have set up your initial view:

```
self -> IDLgrView::GetProperty, VIEWPLANE_RECT=viewplaneRect
self.viewRect = viewplaneRect
self.viewcoord[0] = ((2. * self.viewRect[0]) + $
   self.viewRect[2]) / 2.
self.viewcoord[1] = ((2. * self.viewRect[1]) + $
   self.viewRect[3]) / 2.
```
